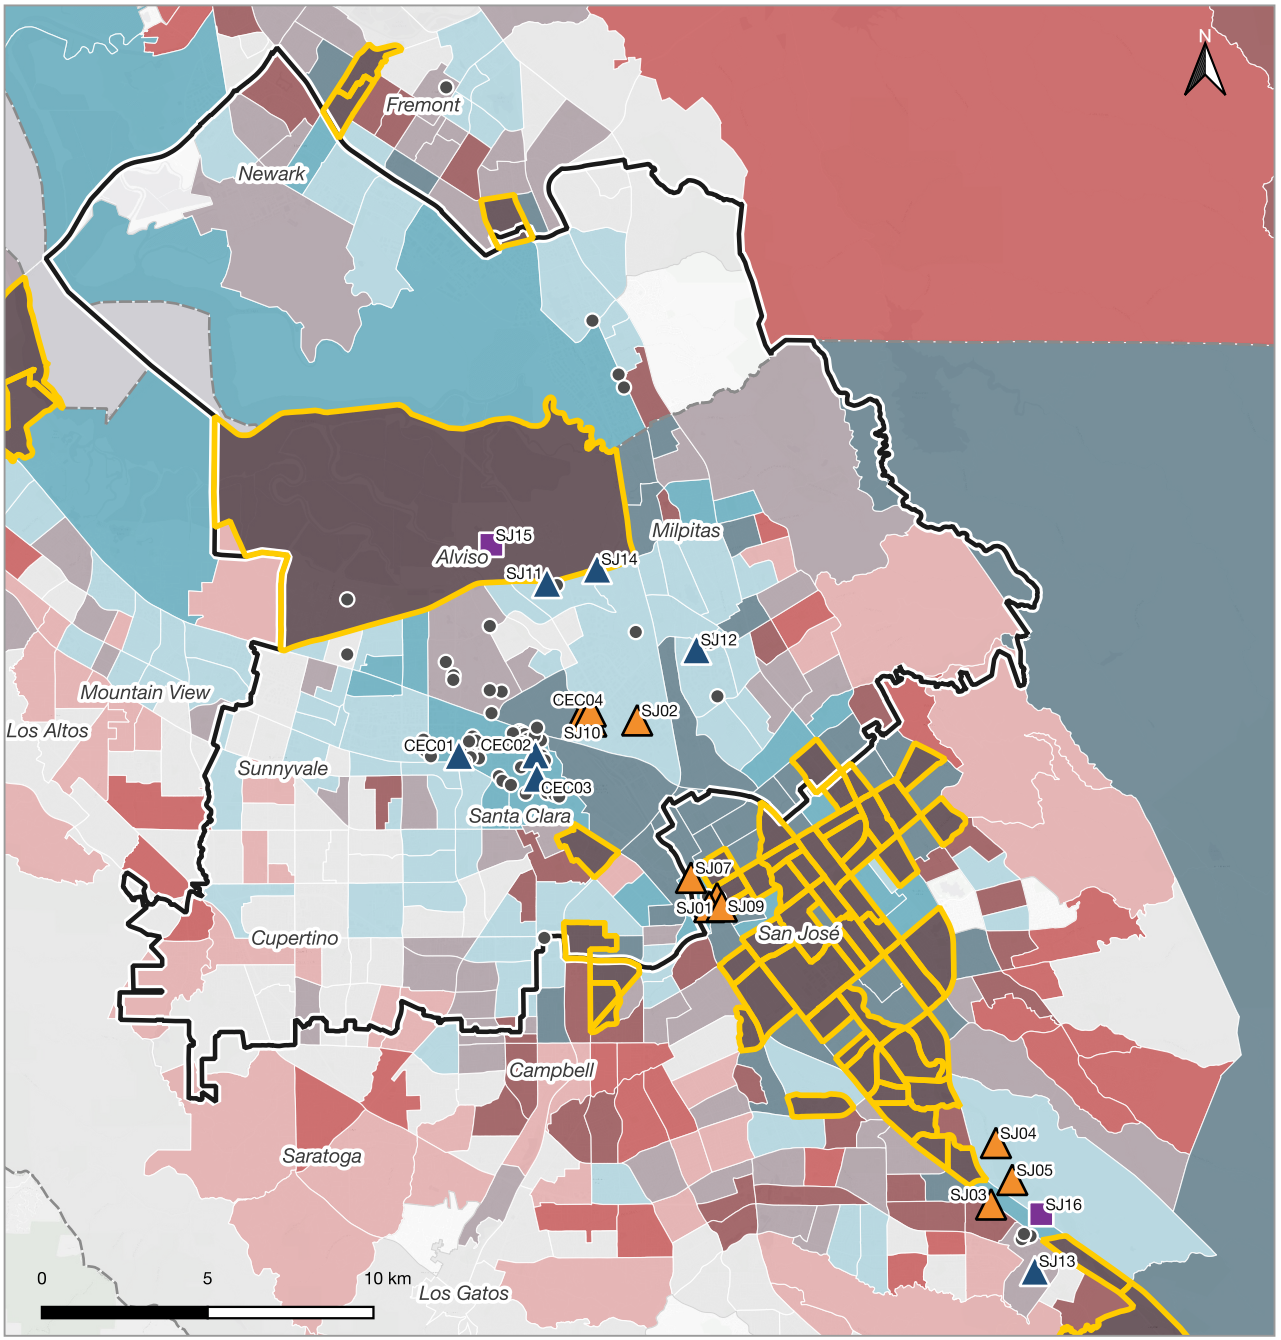

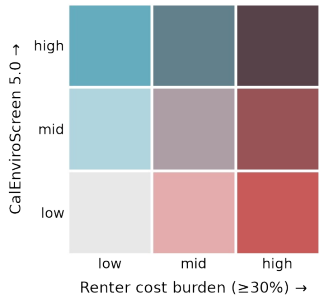

Map 3. Community pressure screening: rent burden × environmental burden × data centers

Tracts classified by regional (Alameda, Santa Clara, San Mateo) terciles of renter cost burden and CalEnviroScreen 5.0 percentile

CA-17 (120th Congress boundary, eff. 3 Jan 2027)

Screen overlap: top tercile on BOTH burden and CES

Documented data-center & large-energy projects (City of San José; CEC)

- Data center — proposed / under review
- Data center — approved / CEC-exempted
- Large energy-use project (not a data center)
- Existing data centers mapped in OpenStreetMap (crowd-sourced)

Tercile cut points (rent burden terciles at 41.1% and 55.1%; CES terciles at the 21.3 and 46.0 statewide percentiles) are computed across all 959 tracts in the three counties, so 'high' is relative to the regional market. Tracts with <50 renter households are not classified. Gold outline = top tercile on both measures; 4 district-set tracts (≈15k residents) meet this test. This is a screening overlay, not a composite index: it identifies where pressures co-occur, not why, and facility proximity does not imply exposure or causation.
